

ABSTRACT

Washing machine lye container

A washing machine lye container comprising two halves which have connecting means on the mouth 1, 2 of their open base section to execute the fixing of the two one to the other; one of the mouths 1 of the two halves comprises a plurality of radial extensions 3, 3a with an opening 4, 4a which has two sections 5, 5a, 6, 6a in whose connecting region it has a smaller diameter 15, 18. The mouth 2 of the other half has a plurality of pins 8 with an axial through hole 10 in whose rear access dowels 13 are contained in the through hole 10. In addition, the pins comprise slots 9 so that the walls can be tapered to a smaller diameter when the pin 8 is inserted into the opening 4, 4a of the radial extension 3, 3a and for spreading when the dowel 13 is driven into the through hole 10 of the pin 8.
